This shows a gross division of K-5 students into three zones. Each zone contains the same proportion of white students. The zones contain close to the same total number of students. The southeast zone is a little smaller due to a physical barrier of the U.C. campus. This smaller population is consistent with the smaller capacity of Willard Junior High.

This shows how the gross three-zone division of K-5 students might be divided into sub-zones corresponding to the four K-5 schools within each zone.

As can be seen from this map, it is not possible to create proper zones for the mid-town schools in intermediate locations. In each of the three zones, two schools fight for the mid-town, making a clean division impossible. In the north, for example, Columbus and Jefferson compete for mid-town. This indicates that only a choice system could fairly allocate children in the mid-town territory.

This whole map can be considered a diagram of how children would have to be moved around if choice prevailed within each of the three zones. For example, it shows that to integrate Cragmont a block of students of at least the size shown would have to be transported from the non-white neighborhoods of the northwest to Cragmont school.
